

**Retrofit now  
and save money!**

**1001 = SIL2  
Only possible with**

ENOTEC. The name stands for InSitu measurements with a solid, reliable, certified quality. Recently, our O2 measurement was SIL2 certified for a one-out-of-one (1001) selection. Consequently, this makes our system unique worldwide: **no other zirconia analyzer meets this requirement.**

This is a significant milestone in the safety assessment of combustion plants. With the 1001 selection, we achieve double protection with a single measurement instead of three. Simplified this means: **noticeable reduction of your costs!**

Would you also like to reach the next safety level? To achieve this, there is no need to buy new equipment. Because we can modify existing devices retrospectively: OXITEC® 5000, COMTEC® 6000, AQUATEC® 1000 and SILOTEC® 8000 are upgradeable premium products. **The conversion is fast, easy and inexpensive. It can be done either in our factory or directly on site – worldwide.**

SIL is the abbreviation for Safety Integrity Level and creates a link to the functional safety of a plant or process. A high SIL value signifies a low failure probability of the process and is therefore a sign of high reliability.

ENOTEC has been offering products and systems for gas analysis since 1980. 100 % Made in Germany with a high degree of accuracy, quality and durability, completely developed and manufactured by ENOTEC. Our flexibility also makes it possible to react quickly to customer requests – worldwide.
